

How to Speed Up Your Pen Drive for Faster Transfer Rate?

Many USB Pen Drive users after few days of usage complain about the decreasing speeds while transferring content from their computer to pen drive and vice-versa

Steps to increase the transfer rate of your USB drive

First of all, right click on your pen-drive and then click on “Format” option. Change the File system from “Fat 32 to NTFS” as the FAT 32 cannot handle large amounts of data. After changing the option, click on “Start” button to format it.

Now go to the properties window of the portable drive and select hardware tab and change the radio button to “optimize for performance“. There you are done. Now enjoy higher data transfer rates.
